

Types of Procedures Included in the Hospital Quality Summary

Knee replacement: A total or partial knee replacement is a surgery (arthroplasty) for people with severe knee damage and pain related to osteoarthritis, rheumatoid arthritis or traumatic arthritis. Surgical site infections (SSI) are infections directly related to surgeries, tend to have significant impacts on patients' lives, and are also costly for consumers and healthcare payers. Most SSIs prevented by following established

Colon procedures: Surgical site infections for colon procedures must be reported for those procedures which also are required to be reported to fulfill reimbursement requirements of the Centers for Medicare and Medicaid Services (CMS). Thirty-seven (37) colon procedures meet criteria for required reporting. Surgical site infections (SSI) are infections directly related to surgeries, tend to have significant impacts on patients'

Deep venous thrombosis (DVT): DVT is a condition in which a blood clot forms in a vein that is deep inside the body. DVT mainly affects the veins in the lower leg and thigh. DVT can interfere with blood flow, and it may break off and travel through the bloodstream, resulting in a pulmonary embolism (PE).

CABG Procedure: Heart bypass or coronary artery bypass graft (CABG) procedures are surgeries that treat blocked heart arteries to create new passages for blood to pass to the heart. CABG surgeries are relatively common; technical errors of using complex equipment may lead to significant complications. Better

Herniorrhaphy: The repair of a hernia or bulging internal organs which protrude through an abdominal opening in the muscle wall. Reportable hernia procedures include inguinal, femoral, umbilical, or anterior abdominal wall repair. In Colorado, these procedures were removed from mandatory reporting and surveillance in hospitals due to the addition for colon procedures in acute care hospitals effective January 1, 2012. Surgical site infections (SSI) are infections directly related to surgeries, tend to have significant impacts

Hip replacement: A total or partial hip replacement is a surgery for people with severe hip damage or pain related to chronic osteoarthritis, rheumatoid arthritis or other degenerative processes involving the hip joint. Surgical site infections (SSI) are infections directly related to surgeries, tend to have significant impacts on patients' lives, and are also costly for consumers and healthcare payers. Most SSIs prevented by following

Breast Procedures: Surgical site infections for breast procedures must be reported for those procedures with at least one incision to the skin in either male or female patients, in either inpatient or outpatient surgery locations. There are 36 breast procedures that qualify in this category. They include open biopsies of the breast, local excisions of breast lesions, insertion and removal of breast implants and radical mastectomies, to name a few. Surgical site infections (SSI) are infections directly related to surgeries, tend to have significant

Central line associated bloodstream infections (CLABSI): CLABSIs are associated with specific intravascular catheters or central lines that must be in place at the time of, or within 48 hours before, onset of the infection. Colorado requires that all adult critical care units, neonatal critical care units Level II/III and III, long-term acute-care hospitals (LTACH), rehabilitation hospitals, and inpatient rehabilitation wards report

Sepsis: Sepsis is a severe illness caused by overwhelming infection of the bloodstream by toxin-producing bacteria. Sepsis is a life-threatening illness, because it causes the immune system to go into overdrive, which can overwhelm the normal processes in the blood and cause small blood clots to form. These small blood clots block blood flow to vital organs, which can lead to organ failure. Sepsis is often life-threatening, especially in people with a weakened immune system or other medical illnesses. Sepsis is caused by a bacterial infection
